

Preparing environnement	
mkdir projec t_name && cd \$_	Create project folder and navigate to it
python -m venv env_name	Create venv for the project
source env_na me \bin \ac tivate	Activate environnement (Replace "bin" by "Scripts" in Windows)
pip install django	Install Django (and others dependencies if needed)
pip freeze > requir eme nts.txt	Create requirements file
pip install -r requir eme nts.txt	Install all required files based on your pip freeze command
git init	Version control initialisation, be sure to create appropriate gitignore

Crea			
l rea	ro.	nro	ലവ
Oica	·	PIU	CUL

django -admin startp roject mysite (or I like to call	This will create a mysite directory in your current directory the
it config)	manage.py file
python manage.py runserver	You can check that everything went fine

Database Setup	
Open up mysite /se tti ngs.py	It's a normal Python module with module-level variables representing Django settings.
ENGINE - 'djang o.d b.b ack end s.s qlitijang - o.d b.b ack end s.p ost gresql', 'djang o.d b.b ack - end s.m ysql', or 'djang o.d b.b ack end s.o racle'	If you wish to use another database, install the appropriate database bindings and change the following keys in the DATABASES 'default' item to match your database connection settings
${\tt NAME-The\ name\ of\ your\ database.}\ If\ you're\ using\ SQLite,\ the$ database will be a file on your computer; in that case, NAME should be the full absolute path, including filename, of that file.	The default value, BASE_DIR / 'db.sq lite3', will store the file in your project directory.
If you are not using SQLite as your database, additional settings such as USER, PASSWORD, and HOST must be added.	For more details, see the reference documentation for DATABASES.

Creating an app	
python manage.py startapp app_name	Create an app_name directory and all default file/folder inside
INSTAL LED _APPS = [Apps are "plugable", that will "plug in" the app into the project
'app_name',

Creating an app (cont)

Creating models

Class ModelN ame (mo del -	Create your class in the app_name/models.py file
s.M odel)	
title = models.Ch arF iel -	Create your fields
d(m ax_ len gth =100)	
defstr(self):	It's important to addstr() methods to your models, because objects' representations are used
return self.title	throughout Django's automatically-generated admin.

Database editing

<pre>python manage.py makemi gra tions (app_name)</pre>	By running makemigrations, you're telling Django that you've made some changes to your models
<pre>python manage.py sqlmigrate #ident - ifier</pre>	See what SQL that migration would run.
python manage.py check	This checks for any problems in your project without making migrations
python manage.py migrate	Create those model tables in your database
python manage.py shell	Hop into the interactive Python shell and play around with the free API Django gives you

Administration

python manage.py create sup eruser	Create a user who can login to the admin site
admin.s it e.r egi ste r(M ode lName)	Into app_name/admin.py, add the model to administration site
http://127.0.0.1:8000/admin/	Open a web browser and go to "/admin/" on your local domain

Management

<pre>mkdir app_na me/ man agement app_na me/ man age men t/c ommands && cd \$_</pre>	Create required folders
touch your_c omm and _na me.py	Create a python file with your command name
<pre>from django.co re.m an age men t.base import BaseCommand #import anything else you need to work with (models?)</pre>	Edit your new python file, start with import

Management (cont)

```
class Command(BaseCommand):
                                                                           Create the Command class that will handle your
 help = "This message will be shon with the --help option after
                                                                           command
your command"
 def handle (self, args, *kwargs):
  # Work the command is supposed to do
                                                                           And this is how you execute your custom
python manage.py my cus tom co mmand
```

Django lets you create your customs CLI commands

Write your first view

```
from django.http import HttpResponse
                                                          code in it.
def index(request):
return HttpRe spo nse ("Hello, world. You're at the
index.")
from django.urls import path
from . import views
app_name = "app_name"
urlpatterns = [
path('', views.i ndex, name='index'),
```

Open the file app_name/views.py and put the following Python

This is the simplest view possible.

command

In the app_name/urls.py file include the following code.

View with argument

```
def detail (re quest, question id):
                                                                             Exemple of view with an arugment
return HttpRe spo nse (f"Y ou're looking at question {quest ion -
id }")
urlpat terns = [
                                                                             See how we pass argument in path
path('<int:question id>/', views.d etail, name='detail'),
{% url 'app_n ame :vi ew_ name' questi on_id %}
                                                                             We can pass attribute from template this way
```

View with Template

Tell mar remplace	
app_na me/ tem pla tes /ap p_n ame /in dex.html	This is the folder path to follow for template
<pre>context = {'key': value}</pre>	Pass values from view to template
<pre>return render (re quest, 'app_n ame /in dex.html', context)</pre>	Exemple of use of render shortcut
<pre>{% Code %} {{ Variavle from view's context dict }} </pre>	Edit template with those. Full list here
<ti tle="">Page Title< /ti tle></ti>	you can put this on top of your html template to define page title

By Olivier R. (OGR) cheatography.com/ogr/ Published 6th February, 2022. Last updated 12th February, 2022. Page 3 of 8.

Add some static files	
'djang o.c ont rib.st ati cfiles'	Be sure to have this in your INSTALLED_APPS
STATIC_URL = 'static/'	The given exemples are for this config
mkdir app_na me/ static app_na me/ sta tic /ap p_name	Create static folder associated with your app
{% load static %}	Put this on top of your template
<pre><link href="{% static 'app_n - ame /st yle.css' %}" rel="st yle she et" type="t ext /cs s"/></pre>	Exemple of use of static.

Raising 404	
raise Http40 4("Q uestion does not exist")	in a try / except statement
question = get ob jec t o r 4 04(Que stion, pk=que sti on id)	A shortcut

Forms	
app_na me/ for ms.py	Create your form classes here
from django import forms	Import django's forms module
from .models import YourModel	import models you need to work with
<pre>class ExempleForm(forms.Form): exemple_field = forms.C ha rFi eld (la - bel = 'E xemple label', max_le ngt h=100)</pre>	For very simple forms, we can use simple Form class
<pre>class ExempleForm(forms.ModelForm): class meta: model = model_name fields = ["fields"] labels = {"te xt": "label_text"} widget = {"te xt": forms.w id get _name}</pre>	A ModelForm maps a model class's fields to HTML form <input/> elements via a Form. Widget is optional. Use it to override default widget
TextInput, EmailI nput, Passwo rdI nput, DateInput, Textarea	Most common widget list
<pre>if reques t.m ethod != "POST": form = Exempl eForm()</pre>	Create a blank form if no data submitted
<pre>form = Exempl eFo rm(dat a=r equ est.POST)</pre>	The form object contain's the informations submitted by the user
<pre>is form.isvalid() form.save() return redire ct(" app _na me: vie w_n - ame ", argume nt= ard ument)</pre>	Form validation. Always use redirect function
{% csrf_token %}	Template tag to prevent "cross-site request forgery" attack

By **Olivier R**. (OGR) cheatography.com/ogr/

Published 6th February, 2022. Last updated 12th February, 2022. Page 4 of 8.

Render Form In Template	
{{ form.as_p }}	The most simple way to render the form, but usualy it's ugly
<pre>{{ field pla ceh old er: fie ld.l abel }} {{ form.u ser nam e p lac eho lde r:"Your name here"}}</pre>	The is a filter, and here for placeholder, it's a custom one. See next section to see how to create it
<pre>{% for field in form %} {{form.username}}</pre>	You can extract each fields with a for loop. Or by explicitly specifying the field

Custom template tags and filters	
app_na me \tem pla tet ags \ ini tpy	Create this folder and this file. Leave it blank
app_na me \tem pla tet ags \fi lte r_n ame.py	Create a python file with the name of the filter
{% load filter _name %}	Add this on top of your template
from django import template	To be a valid tag library, the module must contain a module-level variable named register
<pre>register = templa te.L ib rary()</pre>	that is a template.Library instance
<pre>@regis ter.fi lte r(n ame ='cut') def cut(value, arg): " " " Removes all values of arg from the given string " " " return value.r ep lac e(arg, '')</pre>	Here is an exemple of filter definition. See the decorator? It registers your filter with your Library instance. You need to restart server for this to take effects
https://tech.serhatteker.com/post/2021-06/placeholder-templatetags/	Here is a link of how to make a placeholder custom template tag

Setting Up User Accounts	
Create a "users" app	Don't forget to add app to settings.py and include the URLs from users.
<pre>app_name = "users" urlpatterns[# include default auth urls. path("", include("django.contribe.auth.urls"))]</pre>	Inside app_name/urls.py (create it if inexistent), this code includes some default authentification URLs that Django has defined.
<pre>{% if form.error %} Your username and password didn't match {% endif %} <form action="{% url 'users :login' %}" method="po st"> {% csrf_token %} {{ form.as_p }}</form></pre>	Basic login.html template Save it at save template as users/templates/registration/login.html We can access to it by using Log in< /a>
<pre></pre>

Django Cheat Sheet

by Olivier R. (OGR) via cheatography.com/143343/cs/30794/

Setting Up User Accounts (cont)

```
{% if user.i s_a uth ent icated %}
{% url " use rs: log out " %}
path("r egi ste r/", views.r eg ister, name="r -
egi ste r"),
from django.sh ortcuts import render, redirect
from django.co ntr ib.auth import login
from django.co ntr ib.f orms import
UserCreationForm
def register(request):
 if reques t.m ethod != "POST":
    form = UserCreationForm()
    form = UserCreationForm(data=request.POST)
    if form.is valid():
      new user = form.save()
     login (request, new user)
      return redirect("app name:index")
  context = {"fo rm": form}
  return render (re quest, " reg ist rat -
ion /re gis ter.ht ml", context)
```

Check if user is logged in

Link to logout page, and log out the user

save template as users/templates/registration/logged_out.html

Inside app_name/urls.py, add path to register

We write our own register() view inside users/views.py For that we use UserCreationForm, a django building model.

If method is not post, we render a blank form

Else, is the form pass the validity check, an user is created

We just have to create a registration.html template in same folder as the

login and logged_out

Allow Users to Own Their Data

from django.co ntr ib.a ut h.d eco rators
import login_required
...
@login_required
def my_view(request)
...
from django.co ntr ib.a ut h.m odels import
User
...
owner = models.Fo rei gnK ey(User, on_del ete =mo del s.C ASCADE)

Restrict access with @login_required decorator

If user is not logged in, they will be redirect to the login page

To make this work, you need to modify settings.py so Django knows where to $% \left\{ 1,2,\ldots ,n\right\}$

find the login page

Add the following at the very end

My settings

LOGIN_URL = " use rs: log in"

Add this field to your models to connect data to certain users

When migrating, you will be prompt to select a default value
